Participants

Philip Morris

Don Leyden
Jan Oey
Han-Juergen Roethig
Klaus Rustemeier
Klaus von Holt

Covance

Jeff Eberhard
Jill Schultz
Paul Severin

The following items were discussed:

Acetonitrile in Exhalate Validation Data

Bag recovery is ~60% with an RSD of ~23% at the low concentration and ~5% at the high concentration. PM agreed that this was acceptable.

Philip Morris would like some additional experiments performed to determine the variability in subjects blowing into the bags.

ACTION: J. Eberhard to provide plan and cost estimate to J. Schultz by 10/12/01.

D. Leyden asked if the LLOQ was sufficient to measure levels of acetonitrile smokers and non-smokers. J. Eberhard indicated that 10% to 50% of the samples may be <LLOQ, but that the LLOQ was the lowest that could be obtained.

Philip Morris agreed that the data were acceptable to proceed with sample analysis.
